**Abstract:** MALÍČEK, J., PALICE, Z., BOUDA, F., PEKSA, O., STEINOVÁ, J., SYROVÁTKOVÁ, L. & VONDRÁK, J. 2024. Lichens recorded in the surroundings of Sajathütte and Eisseeöhütte (Hohe Tauern, Austria) in 2022. – Herzogia 37: 300–319.

Four days of lichenological excursions in the surroundings of Sajathütte and Eisseeöhütte (Prägraten, High Tauern) resulted in the list of 428 lichen taxa, 13 lichenicolous fungi and 2 lichen-associated fungi. Five species (*Catillaria cf. nigroisidiata*, *Micarea fennica*, *Microcalicium loraasii*, *Placynthium pulvinatum* and *Rinodina cf. calcigena*) are first records for the Alps. In addition to the taxa mentioned, a further ten lichens are new to Austria: *Caloplaca approximata*, *C. fuscocurfa*, *Candelariella aggregata*, *Halecania spodomela*, *Lempholemma cladodes*, *L. isidiooides*, *Porina rosei*, *Protoparmelia leproloma*, *Protoparmeliopsis bolcana*, and *Stereocaulon capitellatum*. The area harbours an extraordinarily rich lichen diversity. The combination of high-mountain elements with continental or even xerothermic species is remarkable.

**Zusammenfassung:** MALÍČEK, J., PALICE, Z., BOUDA, F., PEKSA, O., STEINOVÁ, J., SYROVÁTKOVÁ, L. & VONDRÁK, J. 2024. Flechten in der Umgebung der Sajathütte und Eisseeöhütte (Hohe Tauern, Österreich) im Jahr 2022. – Herzogia 37: 300–319.

Im Rahmen von vier lichenologischen Exkursionstagen in der Umgebung der Sajathütte und der Eisseeöhütte (nordwestlich von Prägraten, Hohe Tauern) wurden 428 Flechtenarten, 13 lichenicole Pilze und 2 flechtenassoziierte Pilze nachgewiesen. Fünf Arten (*Catillaria cf. nigroisidiata*, *Micarea fennica*, *Microcalicium loraasii*, *Placynthium pulvinatum* und *Rinodina cf. calcigena*) gelten als Neufunde für die Alpen. Zusätzlich zu den genannten Sippen sind folgende zehn Flechten neu für Österreich: *Caloplaca approximata*, *C. fuscocurfa*, *Candelariella aggregata*, *Halecania spodomela*, *Lempholemma cladodes*, *L. isidiooides*, *Porina rosei*, *Protoparmelia leproloma*, *Protoparmeliopsis bolcana* und *Stereocaulon capitellatum*. Das Gebiet beherbergt eine außerordentlich reiche Flechtenvielfalt, wobei die Kombination von Hochgebirgselementen mit kontinentalen oder sogar xerothermen Arten besonders bemerkenswert ist.

**Key words:** arctic-alpine lichens, biodiversity, continental lichens, Eastern Alps, Tyrol.

### Introduction

In summer 2022, Czech lichenologists in cooperation with Austrian and German lichenologists organized a workshop focused on high-mountain lichens. The meeting took place in the Sajathütte (2550 m a.s.l.) in Hohe Tauern Mts. This mountain hut is located just next to the border of Hohe Tauern National Park. Therefore, some of the records come from the national park area. The surroundings of Sajathütte are formed mainly by grazed alpine meadows and rocks. Larch forests grow closer to Hinterbichl and reach up to 1800–2150 m a.s.l. The geological bedrock is very rich, formed mainly by various calcareous silicates, such as prasinite (= calcium-rich greenschist) and calcareous mica schist, but acidic silicates, such as mica schist and phyllite, are also intermixed. The results from the workshop are summarized in this article.

\* corresponding author

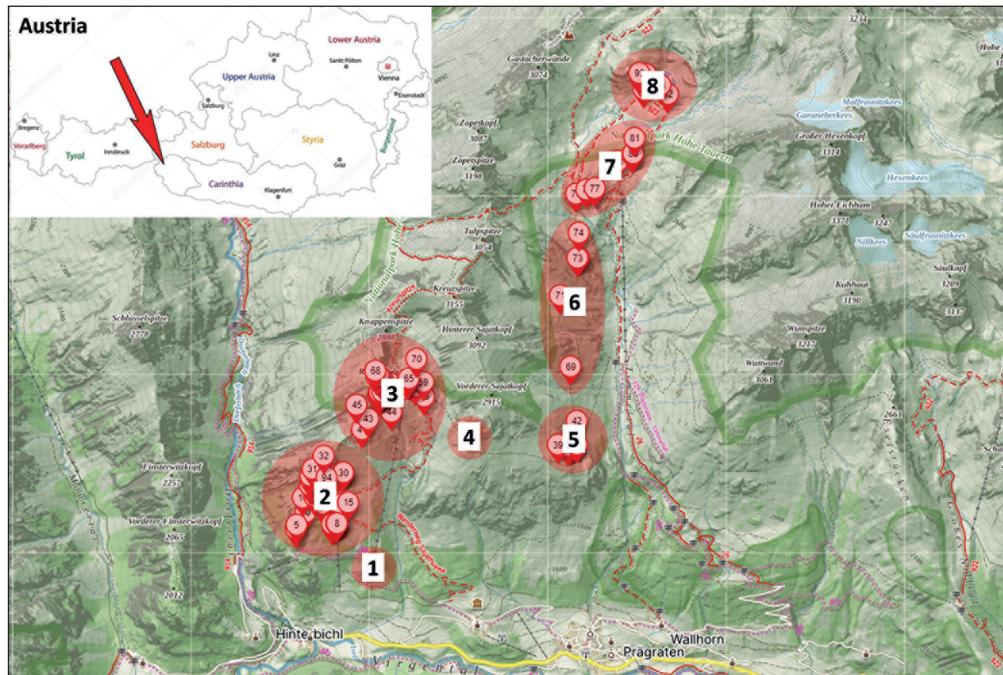

## Material and methods

The area was explored within four days 26–29<sup>th</sup> July 2022. A few additional records come from a pre-excursion on the 6<sup>th</sup> July 2021. We explored the area of the national park and its immediate surroundings. Due to the difficult identification of many species, most of the records are based on voucher collections. The herbarium specimens are deposited in the herbaria of the Czech Academy of Sciences in Průhonice (PRA), Faculty of Sciences at the Charles University (PRC), the National Museum in Prague (PRM), the Museum of West Bohemia in Plzeň (PL), and in the personal herbarium of J. Malíček. In total, we present here 986 floristic records, which are available online as the electronic appendix.

Specimens were identified using standard lichenological methods, including TLC analyses (ORANGE et al. 2010) and barcoding of DNA sequences (nrITS and mtSSU). We newly produced 14 nuclear ITS and 15 mitochondrial SSU sequences (Table 1), following methods by MALÍČEK et al. (2020). DNA was isolated by the ISOLATE II RNA Plant Kit (Bioline) according to the manufacturer's protocol. Species selected for the DNA barcoding could either not be identified to species level by other methods (most cases) or they had no sequences in the GenBank. A standard nucleotide BLASTN search (ALTSCHUL et al. 1990) was used to confirm the identity of the species. The nomenclature follows NIMIS et al. (2018); taxa not included are followed by author abbreviations.

**Fig. 1.** Studied localities, including all 93 GPS points. Map base: Mapy.cz & Depositphotos.com.

### Study sites (Fig. 1)

1. forest area on a S-facing slope between Hinterbichl and Rote Säule, just north of Frösach, approx. 500 m from the parking place, 47.02272N/12.34916E, alt. 1510 m (1 record, 1 species)
2. forests, alpine meadows, prasinite, and calcareous mica schist rocks on steep S–SW-facing slopes of Mt Rote Säule, Katinmäder, 0.7–1.5 km from Hinterbichl, 47.02839N/12.34265E ( $\pm 400$  m), alt. 1775–2150 m (226 records, 146 species)
3. surroundings of Sajathütte and S-facing prasinite and calcareous mica schist rocks below Mt Rote Säule, 47.03715N/12.35173E ( $\pm 400$  m), alt. 2350–2760 m (335 records, 176 species)
4. small prasinite rock outcrop along tourist path on a S-facing slope of Mt Vorderer Sajatkopf (2915 m), 47.03369N/12.36103E, alt. 2410 m (1 record, 1 species)
5. S–E-facing alpine meadows with prasinite rock outcrops 1 km SE of Mt Vorderer Sajatkopf (2915 m), along path to Eissee, 47.03342N/12.37383E ( $\pm 150$  m), alt. 2290–2330 m (56 records, 43 species)
6. E-facing prasinite and calcareous mica schist rock outcrops and alpine grasslands along tourist path 0.5–2.0 km SSW of Eissee, 47.04526N/(12.37336E ( $\pm 800$  m), alt. 2350–2500 m (13 records, 13 species)
7. alpine heath, grasslands and mostly prasinite rock outcrops in the surroundings of Eissee, 47.05596N/12.37814E ( $\pm 400$  m), alt. 2490–2625 m (45 records, 44 species)
8. calcareous and acidic mica schist rocks in the surroundings of Eissee, 47.06296N/12.38377E ( $\pm 200$  m), alt. 2650–2725 m (308 records, 204 species)

### Results and species list

Within our excursions, we recorded 443 taxa: 428 lichen taxa, 13 taxa of lichenicolous fungi and 2 lichen-associated fungi. The species list is predominated by saxicolous lichens (ca. 270 species). The rest is composed of epiphytic, epixylic and terricolous lichens. 15 species are new to Austria, including 5 species new to the Alps. These are commented at the end of the species list.

Substrate abbreviations: **as** – acidic soil, **bryo** – bryophytes, **Cal** – *Calluna vulgaris*, **cs** – calcareous soil, **dw** – dead wood, **epi** – epiphytic, **hum** – humus, **Jna** – *Juniperus communis* subsp. *nana*, **Jsab** – *Juniperus sabina*, **Lar** – *Larix decidua*, **lich** – lichen, **pr** – plant residues, **s** – soil, **sx** – saxicolous, mainly on prasimite or calcareous mica schist rock.

Other abbreviations: # – lichenicolous, lichen-associated or lichen-allied fungus; **FB** – voucher collected by F. Bouda and deposited in PRM, **JM** – coll. by J. Malíček and deposited in his herbarium, **JS** – coll. by J. Steinová and deposited in PRC, **JV** – coll. by J. Vondrák and deposited in PRA, **OP** – coll. by O. Peksa and deposited in PL; **ZP** – coll. by Z. Palice and deposited in PRA; \* – specimen tested by thin-layer chromatography; ! – DNA sequenced.

### Comments on species new to Austria

#### *Caloplaca approximata*

Arctic to boreal species, in the Alps so far known only from a single locality in Switzerland (NIMIS et al. 2018). We collected the species on mica schist rocks, in one case distinctly enriched by calcium, at the Eissee lake.

### *Caloplaca fuscorufa*

This is a poorly known species similar to *C. crenularia* and *C. exsecuta*. For a long time it was known only from a single locality in Sweden. *C. fuscorufa* grows on various kinds of rocks, often on slightly calciferous types, and prefers habitats near water, mainly by streams or brooks or from seepage surfaces (ARUP et al. 2007). It is widespread in Northern Europe; from the Alps there was so far a single record from Switzerland, which needs re-confirmation (NIMIS et al. 2018). We found a single population on a wind-exposed (inclined to vertical surfaces) mineral-rich prasinite rock along the path between Sajathütte and Eisseehütte.

### *Candelariella aggregata*

Species growing on plant debris and cushions of bryophytes. So far there are only a few records from the Alps, but perhaps the species was not distinguished from *C. aurella* in the past (NIMIS et al. 2018). Our specimen was collected on plant debris on calcareous soil on Mt Rote Säule (alt. 2760 m).

### *Catillaria cf. nigroisidiata*

An inconspicuous and very poorly known saxicolous species new to the Alps. It has been described and so far reported only from the Netherlands, where it occurs on anthropogenic substrates (VAN DEN BOOM 2002). We collected a single poor specimen on a calcareous rock in the alpine meadows below Sajathütte (alt. 2350 m).

### *Halecania spodomela*

Inconspicuous lichen associated with cyanobacteria (CANNON et al. 2022) or *Placynthium* species (NIMIS et al. 2018). In Western Europe it occurs on slightly base-enriched siliceous rocks, usually near the coast (CANNON et al. 2022). In the Alps it is known from a single locality in Italy (NIMIS et al. 2018). We collected this species on cyanobacteria on calcareous micaschist stones in the bedrock of the Timmelbach brook flowing out of the Eissee lake.

### *Lempholemma cladodes*

Cyanolichen with characteristic hormocystangia in the swollen apices of the branches (JØRGENSEN 2007). It grows on calcareous rocks in cool situations and is widespread in Scandinavia, but not common. In the Alps, *L. cladodes* has only been recorded in Switzerland (NIMIS et al. 2018). We collected this cyanolichen only once on the seepage of the SE-facing vertical side of a big ‘erratic’ boulder (prasinite) between Hinterbichl and Sajathütte.

### *Lempholemma isidiooides*

The species is similar to *L. botryosum*, but differs in more rosette-like thallus and cylindrical lobes resembling isidia (JØRGENSEN 2007). It grows on irrigated faces of various types of rocks. The species is widespread in Northern Europe and known from scattered localities throughout the Alps (NIMIS et al. 2018). Our single collection is from the seepage on foot of a steep-facing calcareous schist rock close to Sajathütte.

### *Micarea fennica*

A minute pycnidiate species, similar to *M. hedlundii*, growing on wood. It has recently been described from Finland (LAUNIS & MYLLYS 2019) and later reported from Norway (KLEPSLAND 2020) and Russia (KONOREVA et al. 2021). Here it is reported for the first time from the Alps. We collected it on decaying wood of stump in larch forest above Hinterbichl (alt. 1788 m).

### *Microcallicium loraasii*

An inconspicuous calicioid fungus, growing on wood and bark of conifers. It was recently independently described from Norway and the Czech Republic (HOLIEN & FRISCH 2022, VONDRAK et al. 2022 as *M. minutum* Vondrák & Svoboda). Here the species is reported as new to the Alps. We collected it on bark of *Larix decidua* in forests above Hinterbichl (alt. 1790 m). The specimens are very similar to *M. disseminatum* in the absence of whitish pruina and ascospores up to 3-septa. Nevertheless, the ascomata are very small comparing to typical *M. disseminatum* and our identification was confirmed by mitochondrial SSU.

### ***Placynthium pulvinatum***

The cushion-forming arctic-alpine cyanolichen grows on moist calcareous soil. It has been known only from northern Euroasia (WESTBERG et al. 2016). Species new to the Alps. We recorded this species on soil at Eissee lake.

### ***Porina rosei***

Partly misunderstood, often sterile taxon of *Porina* with a finely isidiate coraloid thallus, previously often mistaken for the recently described *Coenogonium nimisii* (MALÍČEK et al. 2023). The species was formerly known mainly as an epiphyte from the European oceanic regions (including the Western Alps; NIMIS et al. 2018), but in inland areas it can also occur on shady overhanging siliceous rocks in humid localities. Even when sterile it can be distinguished from the superficially similar, apparently more oceanic *Coenogonium nimisii* by its finer habitus, distinctly corticate thalline filaments and by a slow K<sup>+</sup> purplish reaction in microscopic slides (see MALÍČEK et al. 2023).

### ***Protoparmelia leproloma***

An arctic-alpine silicicolous species which starts its life cycle on other crustose lichens, mainly *Lecidea paupercula*. The voucher specimen is, however, an autonomous, well developed lichen, not closely associated with any supposed host lichen. In the Alps it is so far known only from Italy above the treeline (NIMIS et al. 2018). Our single collection comes from a wind-exposed prasinite rock on a crest between Hinterbichl and Sajathütte.

### ***Protoparmeliopsis bolcana* (Fig. 3)**

Saxicolous species similar to *P. muralis*, but forming thinner thallus with black-rimmed areoles and apothecia. Its ecological optimum is in the Mediterranean, but it is also distributed in the Western and Southern Alps (NIMIS et al. 2018). The single voucher was collected on a prasinite rock along path between Sajathütte and Eisseehütte (alt. 2315 m).

### ***Rinodina cf. calcigena***

Arctic-alpine species very similar to *R. bischoffii*, growing on calcareous rocks, reported here for the first time from the Alps. In Europe, it was known only from northern part of the continent (MAYRHOFER & MOBERG 2002). Our single record comes from a calcareous rock on pastures between Hinterbichl and Sajathütte. However, the specimen is small and pycnidia with typical conidia were not found. We therefore report this species with some uncertainty.

### ***Stereocaulon capitellatum***

A rare arctic-alpine sorediate species growing on stones and acidic soil. In the Alps it has only been recorded in Switzerland (NIMIS et al. 2018). We collected it on a mossy siliceous rock on the S-facing rock slopes of Mt. Rote Säule. Based on ITS, so far missing from this species in the GenBank database, *S. capitellatum* is related to *S. rivulorum* and *S. alpinum*.

## **Conclusions**

The locality harbours exceptionally rich lichen communities, including a high number of rare species. Typical high-mountain elements are mixed here with continental or even xerothermic species, such as *Buellia elegans*, *Fulglesia fulgens*, *Gyalidea asteriscus*, *Heppia lutescens*, *Ingvariella bispora*, and *Protoparmeliopsis bolcana*. Species newly recorded for Austria in most cases belong to taxonomically difficult and poorly known groups, such as cyanolichens, or inconspicuous microlichens and lichen-allied fungi, such as genera *Micarea* and *Microcalicium*. Nevertheless, some of them are quite distinct (e.g. *Protoparmeliopsis bolcana*) and had to be overlooked in the country. Noteworthy lichens were distributed all over the explored area. A very specific lichen biota with several new species to Austria was recorded on calcareous mica schist rocks in the surroundings of the Eissee lake, located in the national park. This site was also the most species-rich locality with 204 recorded species.

## Acknowledgements

Jiří Machač provided the pictures of several species. Walter Obermayer corrected and commented on the manuscript. We are grateful to Franz Berger for the identification of *Stigmidium cerinae*, Helmut Mayrhofer for the revisions of three *Rinodina* specimens and Matthias Schultz for the identification of *Enchylium polycarpon*. We thank Ivana Černajová, Eliška Konečná, Štěpán Jerhot, and Christian Printzen for their help in the field. Bezirkshauptmannschaft Lienz provided the permission for the research. Martin Grube helped with the administration of the fieldwork. The work was supported by a long-term research development grant RVO 67985939, by Ministry of Culture of the Czech Republic (DKRVO 2024/3.II.a, National Museum, 00023272) and by Pilsen Region (DKRVO 2022–2025/8.1., Museum of West Bohemia in Pilsen).
